Combine "Page to PDF" and "Remote Attachment" objects within the same environment [Open Discussion](#)

- Boaz Doornbos

Currently, when using the Page to PDF and Remote Attachment objects in Deployteq, each object generates its own separate environment.

Because of this, it's not possible to combine both objects in one flow or send multiple PDFs as a single attachment group within the same e-mail.

For example, when two identical objects are placed after each other, Deployteq can send two separate PDFs, but combining a Page to PDF and Remote Attachment in the same environment is not supported.

Several users have requested the ability to:

Select multiple environments within an e-mail to merge their output, or

Manually assign an environment name within the object configuration, so both objects can share the same environment.

This would allow users to generate and attach multiple PDFs (e.g., dynamic pages and remote files) in a single e-mail, improving flexibility and reducing complexity in campaign setup.
