(external) URL check Open Discussion

- **Forum name:** #Verbetervoorstellen

Have the system check external links for validity in emails. People often forget to add https:// or copy paste an url with a leading or ending space (%20).
When working on the email it should give an error (or warning) when an invalid url is given.

Extra bonus points for Deployteq to just get the url and see if a 200 status is given or something else to have a real url-checker function.
