Move Modules Up and Down Within Email Layouts Open Discussion

- TR Tom Riley
- **Forum name:** #Verbetervoorstellen

Currently, repositioning modules within an email layout requires users to drag and drop them into their desired position.

This can be cumbersome, particularly when working with longer emails containing numerous modules. Dragging modules over large distances can be time-consuming and imprecise, sometimes making it difficult to position them accurately.

Proposed Functionality
Add up and down arrow icons alongside the existing copy/duplicate icon within each module's action controls.

Users should be able to:
- Move up: Click the up arrow to move a module one position higher in the email layout.

- Move down: Click the down arrow to move a module one position lower in the email layout.

- Retain content: Preserve all module content, styling, configuration and settings when repositioning.

- Use existing functionality: Continue using drag-and-drop as an alternative method of reordering modules.

- See available actions: Disable the up arrow for the first module and the down arrow for the last module.

Example Use Case
An email developer or CRM executive is building a campaign containing 15 content modules and needs to move a promotional banner two positions higher.

Rather than dragging the module into position, they simply click the up arrow twice to reposition it accurately.

Desired Outcome
A more intuitive and efficient email-building experience within Deployteq, allowing users to reorder modules quickly and precisely using simple directional controls, without needing to rely exclusively on drag-and-drop functionality.
