Webhook mapping: mapping to a selectbox

Deployteq - Suzanne Martens - 2024-07-09 - Comments (0) - Data, Webhooks & API's

Mapping a value to a select box: pay attention to capitalization!

If you have a value in your webhook call that you want to map to a select box, such as the field n**ewsletter_optin**, make sure to send the value in uppercase in the JSON script, as follows:

"newsletter_optin": "YES"

A value like **yes** or **Yes** will not be processed by Deployteq.

In that case, the webhook call will leave the opt-in field empty, which Deployteq will interpret as a No when checking which customers can receive emails. This could result in a large portion of your customers becoming non-mailable!
